

Finite Element Analysis (FEA)

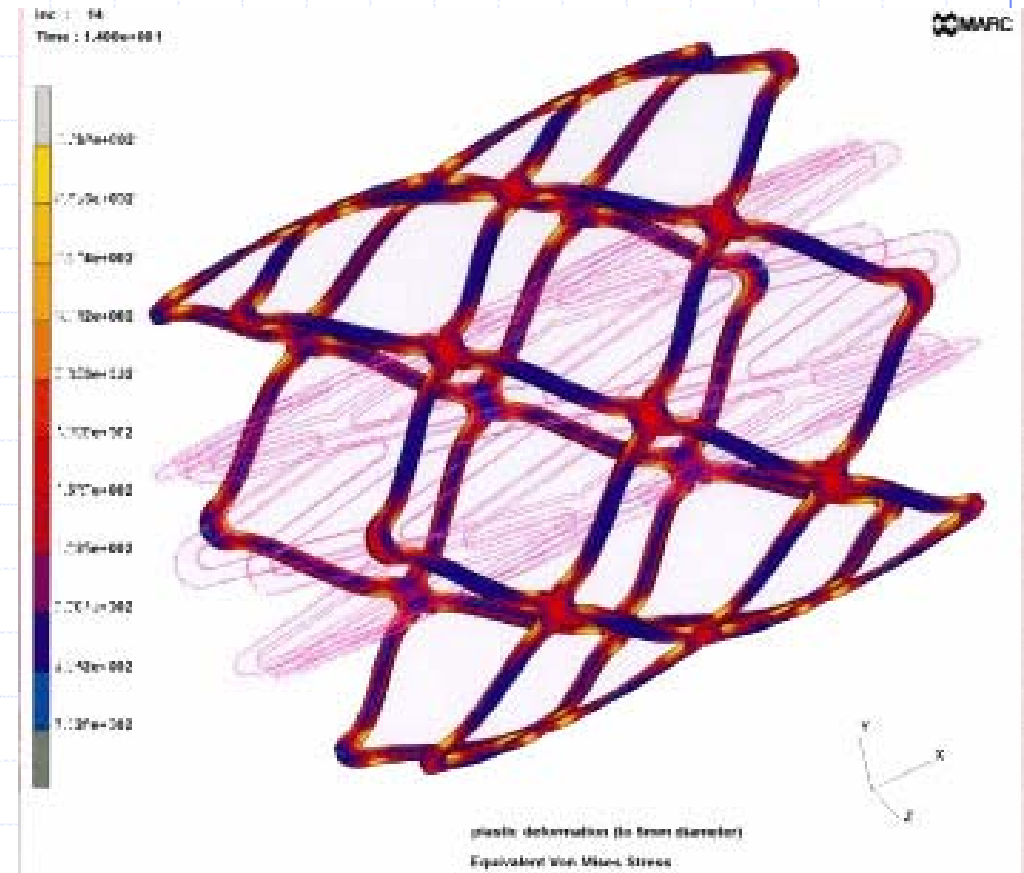

What Is FEA?

- ◆ Computer model
- ◆ Allows numerical solution of equations of complicated geometries
 - divided into many small regions called "finite elements"
- ◆ Assemblage of all elements' equations produces a large matrix
- ◆ Simulation

Use of FEA

- ◆ Structure
- ◆ Solid mechanics
- ◆ Dynamics
- ◆ Thermal analysis
- ◆ Electrical analysis
- ◆ Biomaterials

Analysis of coronary stents

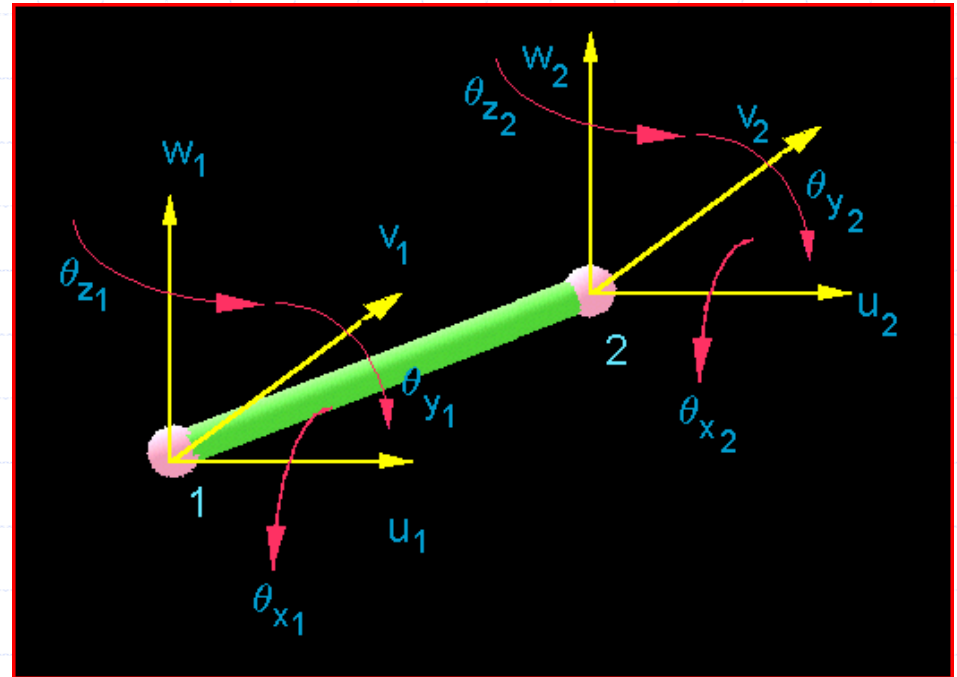

Why The FEA?

- ◆ Greater flexibility to model complex geometries than
- ◆ Used in solving structural, mechanical, heat transfer, fluid dynamics, etc.
- ◆ Much cheaper than if each sample was actually built and tested

How Does It Work?

- ◆ Uses system of points called nodes which make a grid called a mesh
- ◆ Mesh is programmed to contain the material and structural properties.
- ◆ Defines how the structure will react to certain loading conditions

Preprocessing

- ◆ Construct a FE model of the structure to be analyzed
- ◆ Can be in either 1D, 2D or 3D form
- ◆ Primary objective is to replicate important parameters & features of the real model
 - utilize pre-existing digital blueprints, design files, CAD models
- ◆ Preprocessing Link

- ◆ Once created, a meshing procedure is used to define and break the model up into small elements

A Quarter of
Object

Discretize the solid

Mesh of the
3D Solid

Element

Node

Analysis

- ◆ Series of computational procedures involving applied forces, and the properties of the elements which produce a model solution
- ◆ Effects such as:
 - Deformations, strains, and stresses
 - ◆ Caused by applied structural loading conditions

Use a simple function
to approximate the
displacements in each
element

Formulate a set of
linear equations with
displacements at each
node as unknowns

Solve linear equations

Variables Within The System

- ◆ Mass, volume, temperature
- ◆ Strain energy, stress strain
- ◆ Force, displacement, velocity, acceleration
- ◆ Synthetic (User defined)

Input

Boundary Conditions
(prescribed force,
prescribed
displacement, etc.)

Output

Stresses, Strains,
Displacements, at each
material point ($X_1, X_2,$
 X_3)

Postprocessing

New Developments in FEA

- ◆ Integrating FEA into CAD design software
- ◆ Self-adaptive analysis
- ◆ Analysis of problem of huge size
- ◆ Multi-scale analysis
- ◆ Multi-physics analysis

hip endoprosthesis

Case Study

- ◆ Incorrect acetabular cup
 - 2mm larger than reamed hip

- ◆ Correct
 - Significant decrease in stress

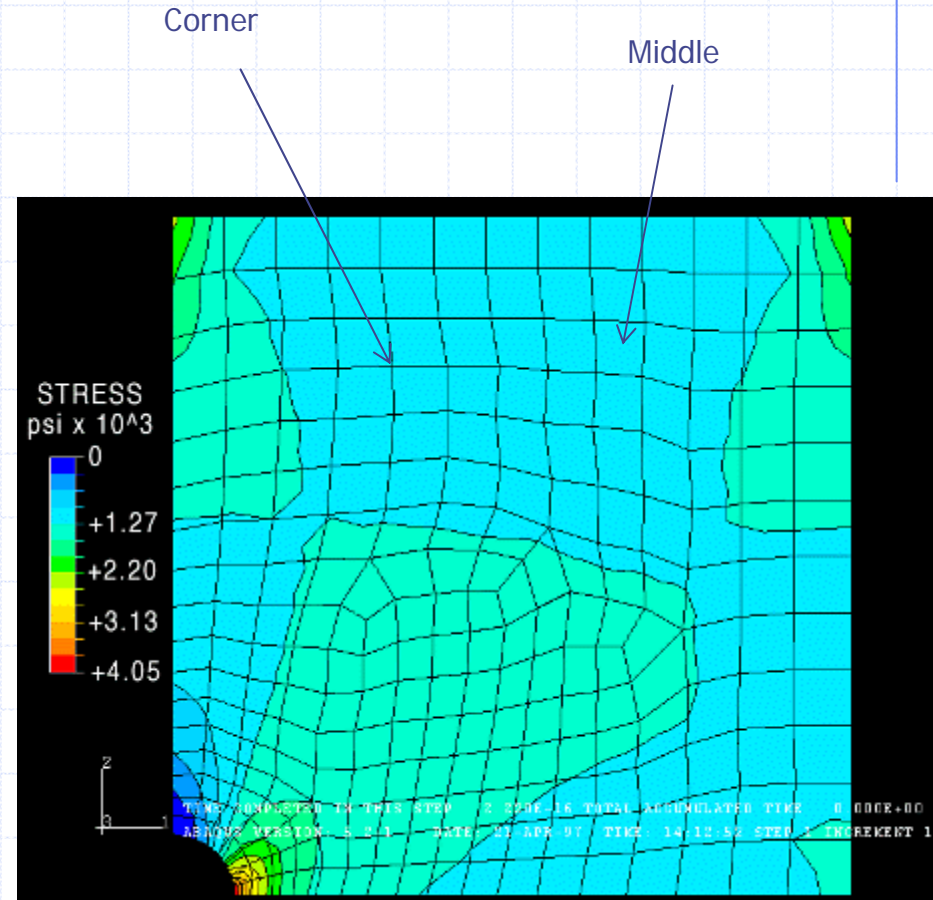

Helpful Examples

- ◆ http://www.endolab.de/computer/computersimulation_e.htm

The End

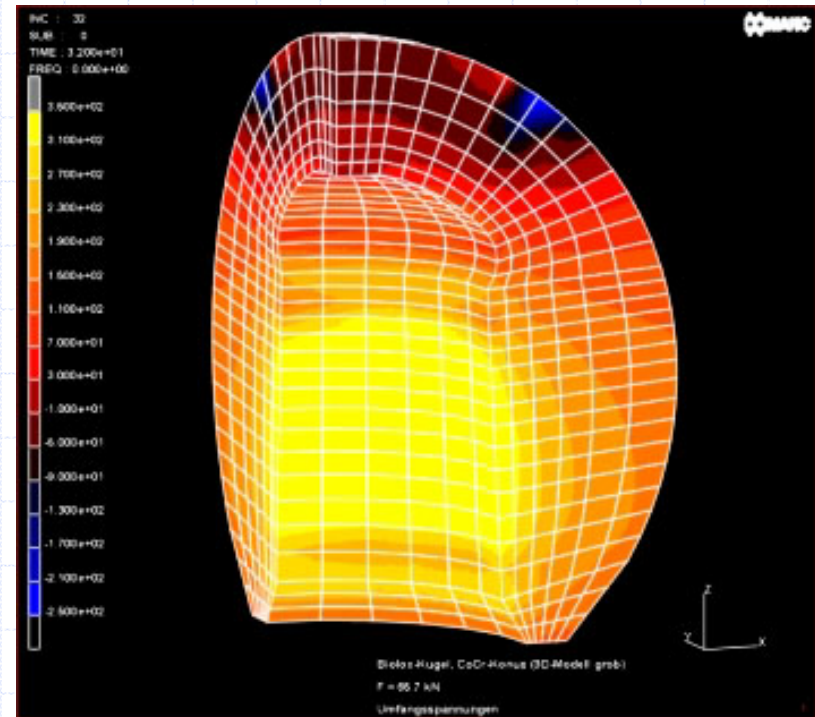

Nodes

- ◆ Points at which elements are jointed
- ◆ Nodes are the locations where values are to be approximated
- ◆ Can be either at the corner or middle of element

Nodes

- Certain density throughout material
- Bounded by sets of nodes, and define localized mass and stiffness properties of the model

Loading Conditions

- ◆ Point, pressure, thermal, gravity, and centrifugal static loads
- ◆ Thermal loads from solution of heat transfer analysis
- ◆ Enforced displacements
- ◆ Heat flux and convection
- ◆ Point, pressure and gravity dynamic loads
